

Quick Tile Editor

The **Quick Tilemap Editor** is a Unity Editor extension that streamlines 2D, 2.5D and 3D level design. It combines IMGUI and UIElements for a fast, responsive workflow, plus built-in JSON save/load and prefab-based object placement.

Getting Started

1. Install Packages

Tools > Quick Tilemap Editor > Install Required Packages

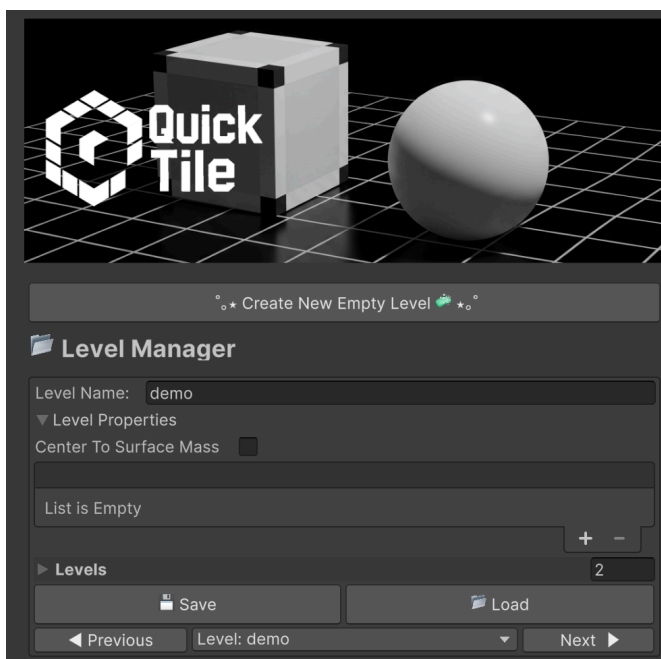

– Installs the 2D Tilemap, Extras, and AI Navigation packages via the Package Manager.

2. Open the Editor

Tools > Quick Tilemap Editor

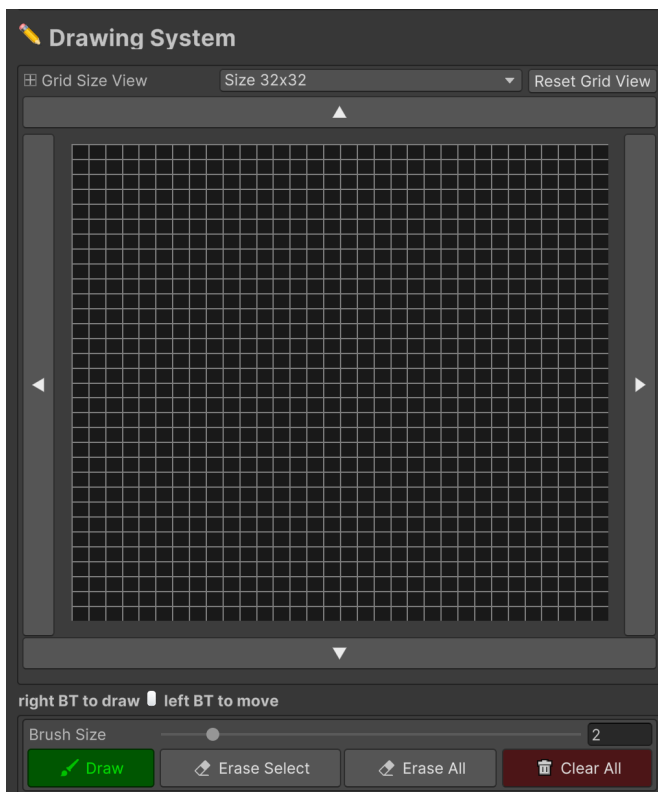

– If no Grid exists, one will be created with a QuickTilemapEditor component.

3. Interface Overview

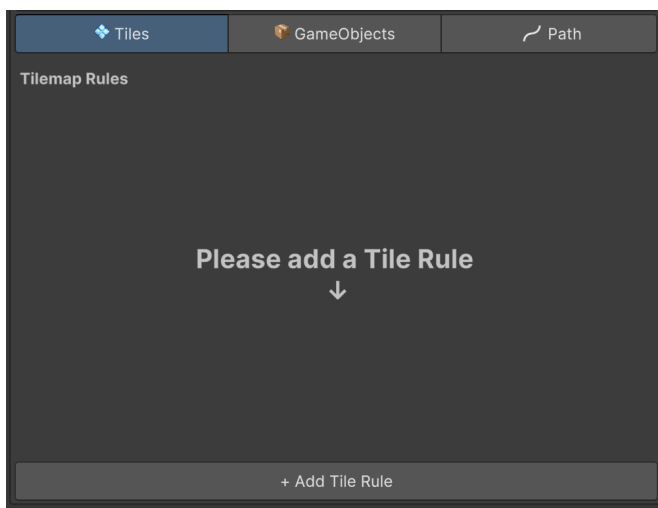

◦ **Create New Empty Level** button

◦ **Level Manager**: name, save/load, previous/next navigation

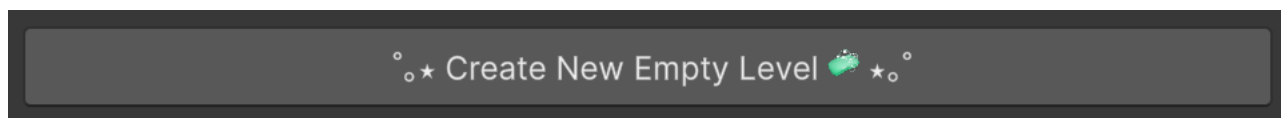

◦ **Drawing System:** grid view with pan/zoom controls

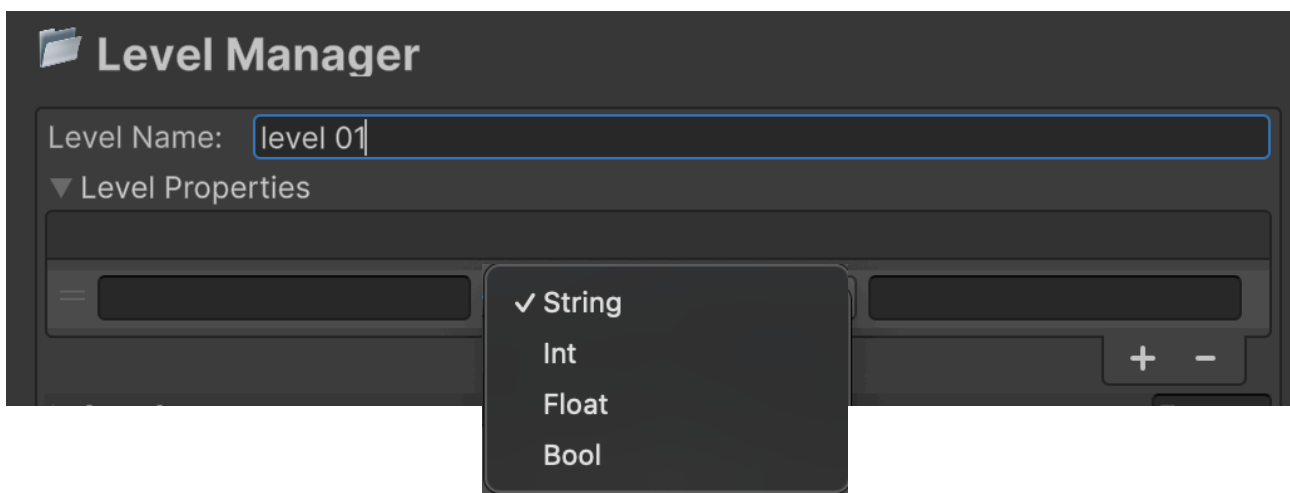

◦ **Tabs:** Tiles / GameObjects / Path

📁 Level Management

- **Create New Empty Level**
Clears everything and makes a blank JSON file in **Assets/Resources/Levels/ <LevelName>.json**.

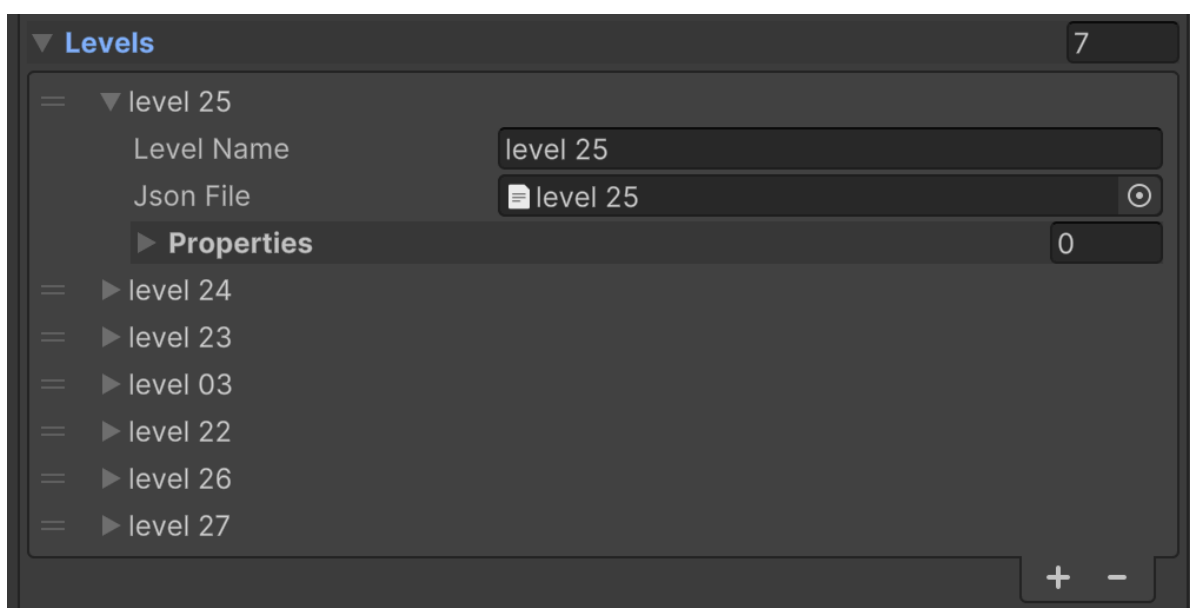

- **Level Name**
Enter a name (alphanumeric, no spaces) to identify your level.

- **Save** (📁 Save)
Serializes all tilemaps, object placements, rules, and paths to JSON.
- **Load** (📁 Load)
Open any .json in your **Resources/Levels** folder to restore a level exactly.
- **Previous / Next**
Quickly page through your saved levels.

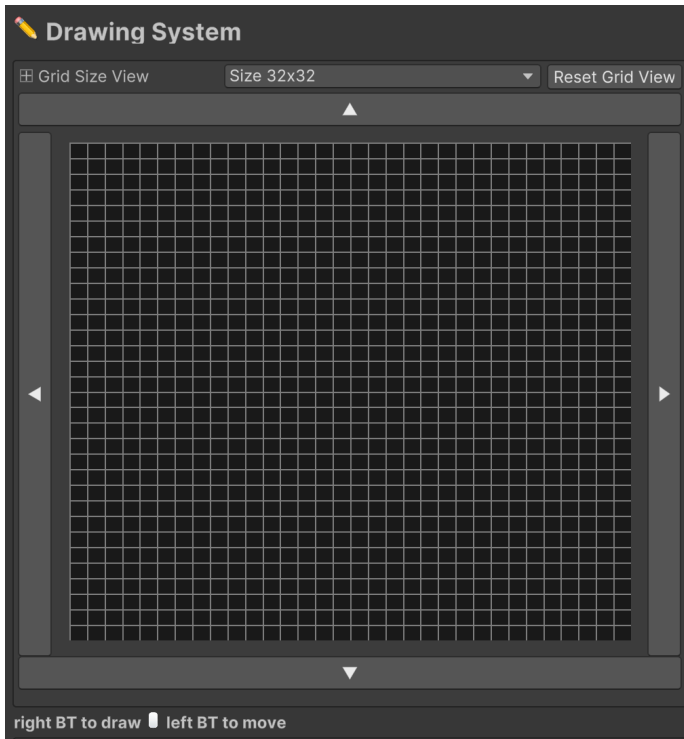

- **Level Properties** (foldout)
Add arbitrary key/value pairs for runtime hooks (e.g. "music=overworld", "difficulty=hard").

Drawing System

Grid Controls

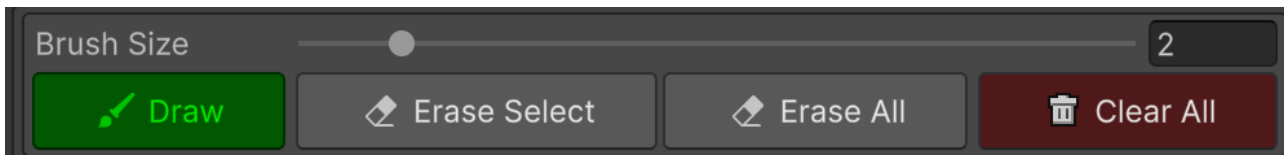

- **Preset Sizes:** 7×7, 16×16, 32×32, 64×64 or Custom

- **Reset Grid View:** centers the camera

- **Arrow Buttons / Right-drag:** pan around

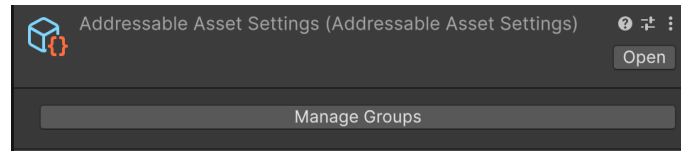

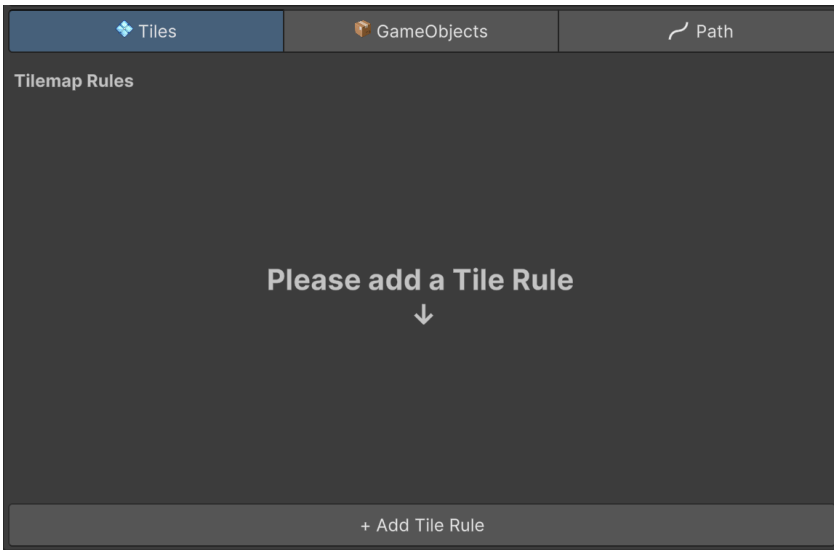

- **Left-click:** paint/erase based on current mode

Modes & Brushes

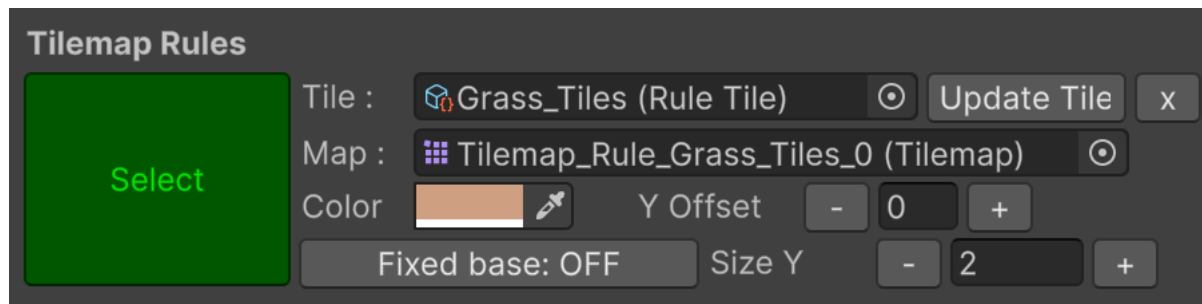

- **Brush Size** (1–10): how many tiles you affect
- **Draw** (green): paint tiles or spawn prefabs
- **Erase Select** (red): clear only the active rule layer
- **Erase All** (red): clear every tilemap layer & objects
- **Clear All:** full wipe (with confirmation)

Tile Rule Management

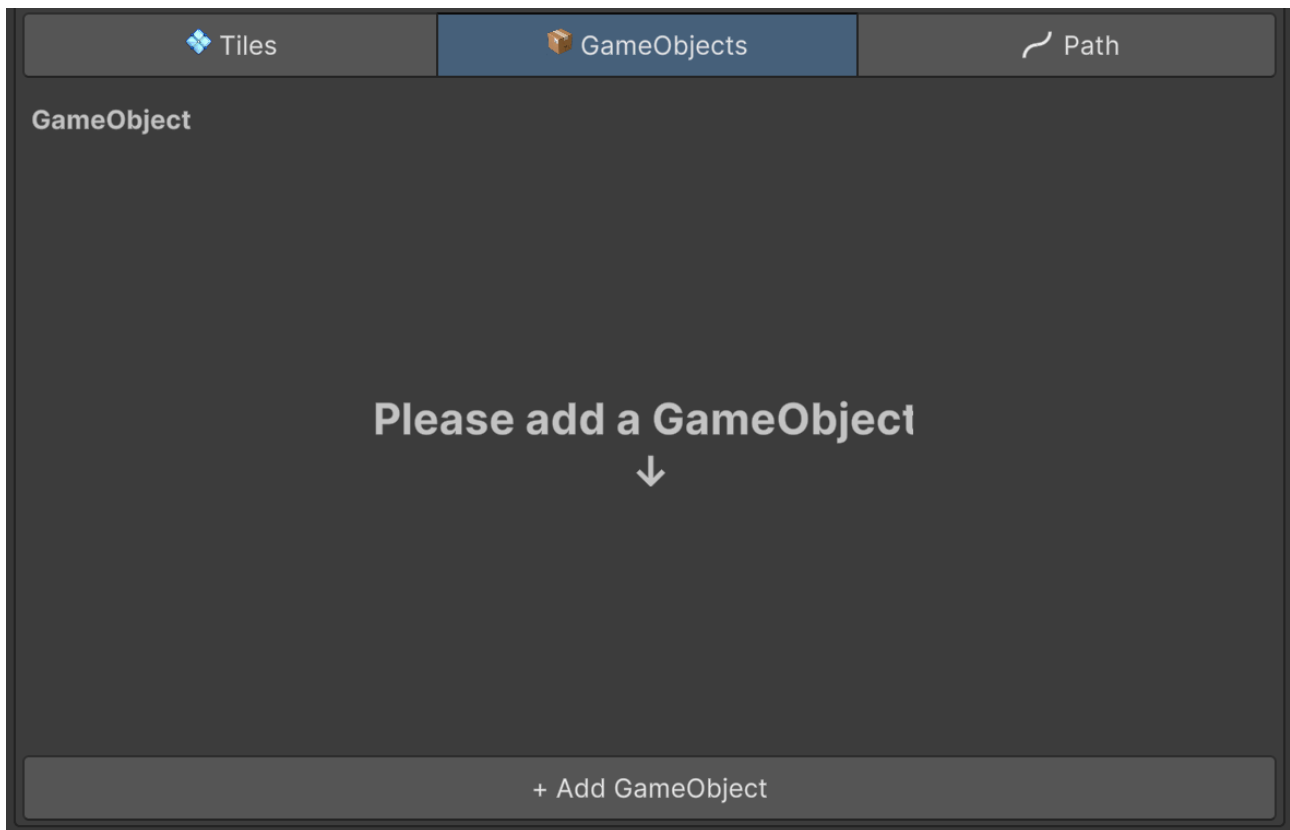

⚠ only Addressable gameobject

1. **Tiles** tab → **+ Add Tile Rule**
2. For each rule you configure:
 - **Tile Asset** selection
 - **Color** tint
 - **Y-Offset** (layer height simulation)
 - **Fixed Base** toggle (maintains perspective when stacking)

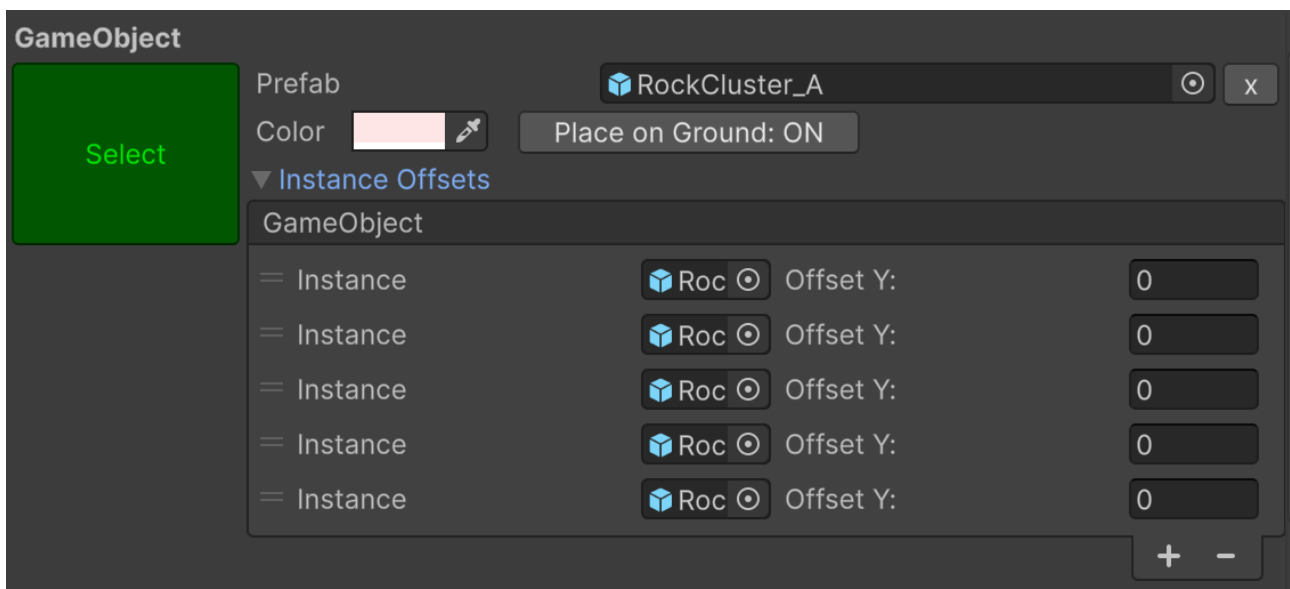

3. **Selecting** a rule (green “Select” button) makes it the active paint brush.

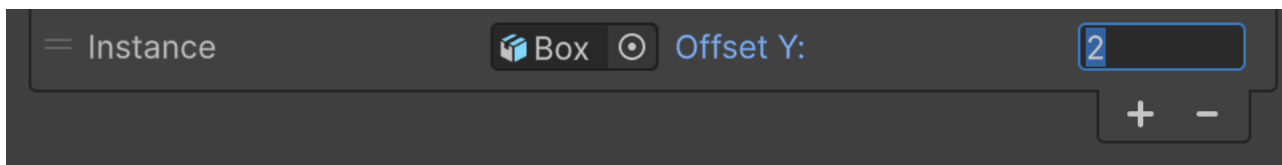

GameObject Placement

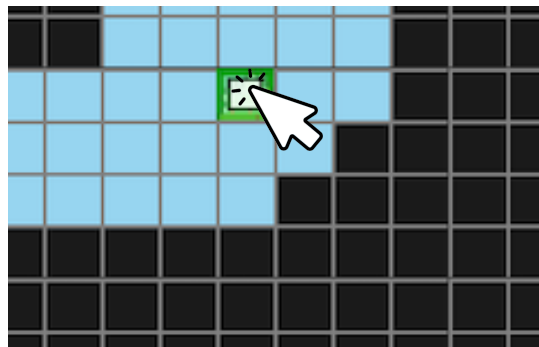

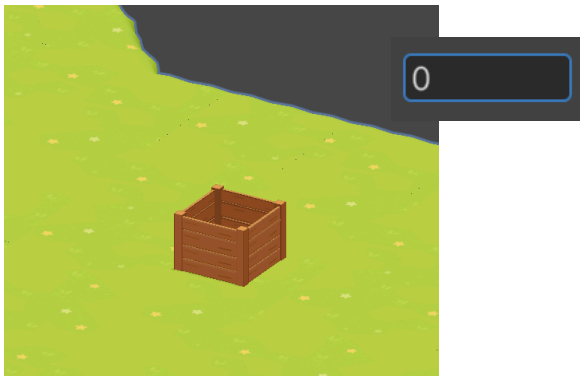

1. **GameObjects** tab → **+ Add GameObject**

2. For each rule you configure:
 - **Prefab** to instantiate
 - **Color** preview tint
 - **Place on Ground** (only where a tile exists)

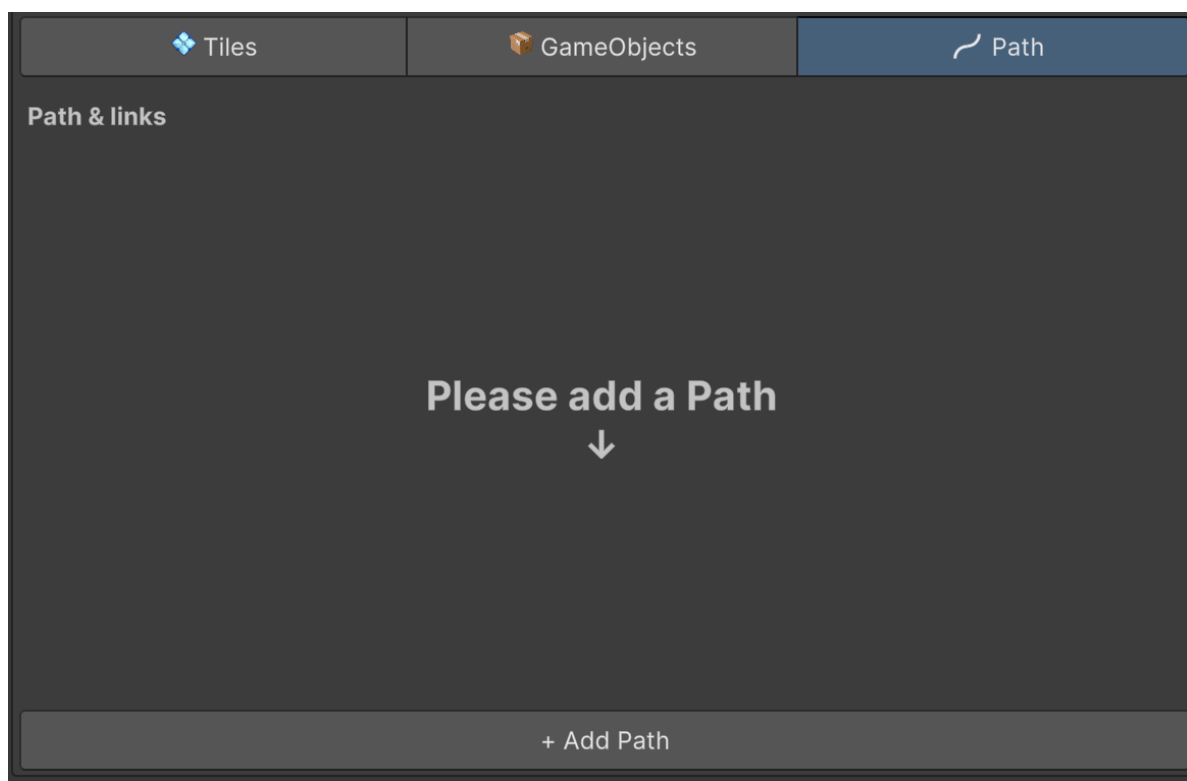

- **Instance Offsets** list (per-instance Y adjustments)

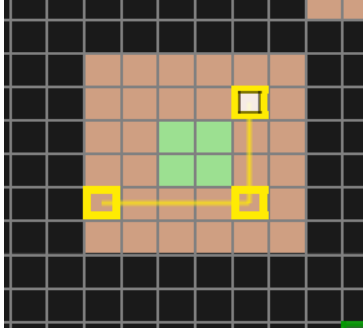

Left-click on grid to spawn; click again to rotate by 45°.

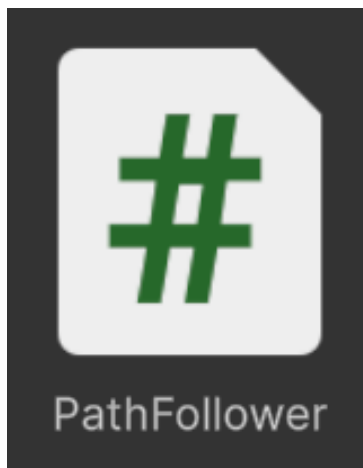

Path System

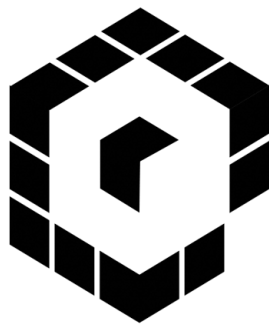

1. **Path** tab → **+ Add Path**
2. With a path selected, **left-click** the grid to add waypoints.
3. **Close Path** connects last point back to the first.

4. Any object placed on a path point is automatically assigned that route (requires the PathFollower component on your prefab).

⚠ to move the GameObject prefab need Pathfollower , be sure to add it to your prefab
